

Sprint review 2

2013-09-30

1. What has been done?
 - a. It's now possible to send notifications to the Android system at a specific time (for task reminders etc). The classes used for notifications (NotificationHandler and AlarmReceiver) are tested to the best possible extent.
 - b. The database is now tested and completed.
 - c. The side panel (navigation drawer) has now been replaced with swipeable tabs.
 - d. The MainActivity and TabsPager (used for the swipeable tabs) is now tested.
 - e. A large portion of the edit user story is finished.
 - f. Several additions has been made to the "Add new task"-GUI.
 - g. A basic productivity clock has been added.
2. Is there any goals that hasn't been reached, and if so, why?
 - a. Tests for list adapters not implemented due to them having been in need of restructuring; tests made before restructure would have been useless.
 - b. The edit-task user story has not been fully implemented since we needed access to the finished add-task dialog.
 - c. It is still not possible to fill out every field of a new task, and it doesn't make use of the database yet. This also affects the edit-task user story as mentioned above .
 - d. The notification reminders is yet to be fully connected with the UI. For now, it's only possible to set a reminder for some predefined dates and times.
3. Are there any actions that are necessary to prevent future discrepancies?
4. Any additional comments?
 - a. We feel relatively satisfied with the last sprint based on added features, now we just need to plan our future sprints more accordingly.
