

Changelog v0.3

2013-10-04

Tests

Test for add and remove as well as more general methods in task and event adapters implemented

Application

* Create list object

When creating objects a custom time can be set and the entire objects is now saved into the database.

* Edit list object

It is now possible to edit the title, comment, location and importance of an already created list object.

* Pomodoro Productivity Clock

There are now 2 different timers, one for “work time” and one for “break time”. Timers are set to 10 seconds and 5 seconds, respectively, in order to illustrate functionality (will be set to 25 minutes and 5 minutes for final release). Initial notifications have been added to alert the user of when the timers run out. Buggable if you switch orientation or navigate away from the timer. Will be fixed in a future iteration. Comments will be cleaned and improved for next release.

GUI

* Adding a new list object

The interface for adding a new list object now offers working spinners for set days and times aswell as user-defined values for these.

* List object lists

Clicking on a list object once shows additional data about that object. Holding your finger on it brings up options to edit or remove the object. Click on it again to remove these options.

* Side panel

The sidepanel has been reimplemented and is used to access the pomodoro clock. Event list is set as home screen.

*** GUI autogenerated blocks**

A GUI for viewing earlier generated blocks has been added, together with a view for adding new autogenerated blocks aswell. The GUI of this is not connected to any logic at the time.

*** Interactive notifications**

It's now possible to mark a task as done directly from a reminder notification. You can also snooze a reminder for one hour.
