

Mentor meeting 3 - October 1st 2013

- Good tests (understanding)
- GPL3 license - good that we have a licence, but a motivation for why we use what we use would be nice
- Justify our use of a certain API level
- Good to have extra documentation that isn't required (big plus for final grade)
- If something is supposed to work but isn't - write it in the sprint review
- Application looks good - following guidelines
- No direct changes needed - keep up the good work!
- Design documentation - more like a user manual
- Some sort of user manual is required - doesn't need to be advanced, some simple manual is good enough
- Justify design changes etc in post-mortem report
- No need for a "beginner" guide in app - just write a user manual document
- Include all features in user manual so that the teacher can check the features
- The presentation isn't graded, it's in order to introduce our classmates to our app
- During code quality week - keep focusing on implementing features, just make sure the code looks decent
- Release 5 - can keep adding features - small features or improve features. It is a separate release after all
- Document changes accordingly (changelog etc)
- Keep writing tests
- Make sure all the old features work with the new ones
- Not worth using pivotal tracker now (for product backlog)
